# Alairo ARC Alarm Receiver and Communicator

### SAFETY, COMMUNICATIONS, AND EFFICIENCY FOR TODAY'S HEALTH CARE CHALLENGES

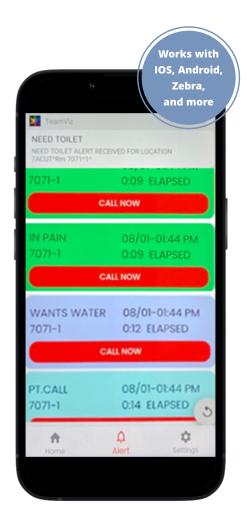

## Simple, Practical Mobile Alarm

## **Delivery and Management**

Care teams can benefit greatly from the convenience and capabilities of mobile phones. Having one place to access patient care information and other applications saves time and effort.

Complexity is the enemy. The mobile presentation of information can't be cumbersome to support fast response and handle multiple alerts.

**Alairo ARC** offers a simplified Alarm interface designed for mobile devices. It offers a lower cost option that delivers only the features needed.

#### Positioning – just the features nurses need...

ARC delivers more features than basic communications applications, without the cost and complexity associated with full featured CC & C (Clinical Communications and Collaboration) system.

#### Built for growing Health Care environments

ARC can easily scale to large numbers of mobile devices, as it is a low bandwidth application on the network. It also delivers more context and control than a SIP based, direct approach.

#### Cleaning, room ready and discharge notifications

Other relevant messages can be pushed to mobile devices to improve operations and efficiency.

#### **Fast Alarm Delivery**

ARC uses the Alairo Orchestrator system to quickly route alarm information through the various systems in the telecommunications chain. Alarms reach the phone within 3 seconds of Nurse Call activation.

#### **One-button call to patient room**

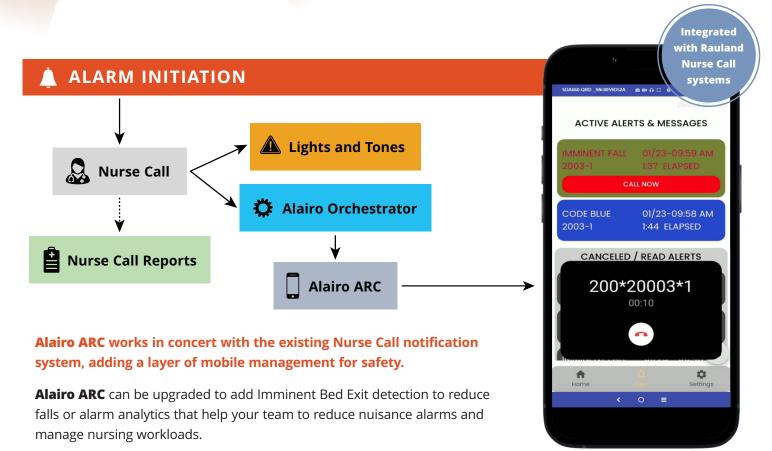

Having a simplified way to quickly call into the patient's room is critical in intercepting a bed exit. Sometimes, the nurse just needs to buy a little time to get there, and a quick acknowledgement is often enough to avoid a potential incident.

#### **Unique tones**

Depending on the alert type, different tones can be used to signify urgency. This helps nurses to react appropriately without having to look at the application, depending on the activity in process.

#### **Alarm Queuing**

By presenting a list of active alarms, clinical professionals can scroll through alarms and prioritize their response to meet safety and patient satisfaction needs.
